Summary

I'm a Computer Engineer specializing in AI engineering, building production AI agents, multi-agent systems, RAG pipelines, and machine learning models, alongside full-stack web and native iOS applications. I take products from design to deployment on cloud and self-hosted infrastructure, with a focus on measurable business impact. I have a strong interest in data science, open-source technologies, and scalable systems. I enjoy leading projects end to end, collaborating across cross-functional teams, and sharing knowledge through documentation and mentoring.

Education

2022 - 2026 B.Sc. in Computer Engineering at **Istanbul Ticaret University**

- Graduated: June 2026, GPA: 3.50/4.00

2022 - 2025 **İŞ'TE İSAR** Professional Development Program

- Three-year mentorship program learning from prominent business leaders in management, marketing, finance, and technology.

Experience

Sep 2025 - Sep 2026 **Software Engineer Intern (Loyalty & AI Teams)** at Amadeus IT Services

- Architected a Django-based multi-agent orchestration platform with four specialized sub-agents integrated with internal databases, ticketing systems, enterprise APIs, and RAG document repositories, including access controls and audit logging. Achieved 90% task execution accuracy; approved by the company's R&D Center.
- Built AI-powered test scenario generation, large-scale test data creation, and end-to-end execution, reducing manual QA effort by 40%; approved by the company's R&D Center.
- Developed AI agents for Jira MCP-based sprint planning and backlog analysis across 1,980+ items, secure publishing with validation and user-controlled releases, and template-based presentation and document generation that cut documentation effort by 50%.
- Built a product support intake workflow that captured and tracked 100% of requests across four product areas.
- Created AI agent development playbooks, reducing developer ramp-up time by 50%.

Summer 2025 **Software Engineer Intern** at Kastamonu Entegre

- Built a hybrid RAG system using SQL Agents, FAISS, and LangChain to process and query multi-format documents. Integrated OpenAI, Gemini, and local models, and deployed the FastAPI and Gradio application on Google Cloud Run. Reduced information retrieval time by 85% compared to manual document search and analysis, achieving 90% accuracy for structured data queries.

Summer 2024 **Hardware Intern** at İkom Bilişim

- Developed a Linux driver to enable communication between two MCUs using the SWD protocol and created a Flask application to display various device information retrieved from MongoDB.

Summer 2023 **Data Science Intern** at Simpplr

- Performed testing and evaluation of LLM products through accuracy analysis, prompt engineering, and ground-truth table creation. Developed an evaluation dashboard using Streamlit.

Projects

Maneki: Focus & Meditation (iOS) *(In App Store review)*

- Built a native iOS focus app where every completed session crafts a porcelain lucky-cat figurine for a 3D garden, using SwiftUI, Swift 6, RealityKit, and a Convex backend with Clerk SSO authentication.
- Implemented timer, Pomodoro, guided breathing, and meditation modes, real-time group focus rooms, home screen widgets, Live Activities, Control Center controls, and Apple Health Mindful Minutes sync.
- Designed a server-authoritative reward economy with StoreKit 2 subscriptions and in-app purchases verified on the backend, localized the app into 10 languages, and covered backend rules with automated tests.

Cozy Window: Pixel-Art Digital Gift Rooms [cozywindow.space]

- Built and launched a full-stack web app, used by 100+ people, where users decorate a personal pixel-art room and share it as a digital gift through a private link, using Next.js, React, TypeScript, Convex, and Clerk with both anonymous and signed-in sessions.
- Developed a drag-and-drop room editor with a catalog of 290 pixel-art items, keyboard controls, and live updates on shared rooms, with Premium assets authorized and served on the server side.
- Integrated Polar one-time payments with signed webhooks, refund handling, and localized pricing, and deployed the app on a self-hosted VPS with Coolify, Cloudflare, and automated Convex production deploys.

Autonomous Portfolio Management in Crypto Spot Markets: Experimental Analysis and Development of Hybrid AI Approaches [Github Repo]

- Led a TÜBİTAK 2209-A project building an end-to-end BTCUSDT spot trading prototype covering data ingestion, feature engineering, forecasting, LLM-based decisioning, and risk control.
- Compared 6 model families (ARIMA, Prophet, XGBoost, LightGBM, LSTM, GRU) with walk-forward evaluation; ARIMA and Prophet reached 75.0% and 72.73% directional accuracy, versus ∼54% for ML/DL models.
- Built a FastAPI + React dashboard with 30+ API endpoints for model training, predictions, live agent loops, risk status, and trading journals.
- Validated the live Spot Demo trading flow over 100 BTCUSDT decisions and 1,000+ USDT in trading volume.

Land Use and Land Cover Classification [Github Repo]

- Built a PyTorch transfer learning pipeline for EuroSAT land-cover classification (10 classes, 27,000 images) with VGG16-BN and MobileNetV2 on an NVIDIA RTX 6000 GPU, using stratified splits, augmentation, class-weighted loss, and early stopping.
- Evaluated models with macro F1, AUC, ROC curves, confusion matrices, and latency analysis, achieving up to 96.7% test accuracy.

Skills

Programming:	Python (Advanced), Java (Intermediate), TypeScript (Intermediate)
Web Development:	React.js, Next.js, Node.js, Django, Flask, FastAPI, Spring Boot
Data Science & ML:	NumPy, pandas, Scikit-learn, TensorFlow, PyTorch, OpenCV, XGBoost, LightGBM, Visualization: Matplotlib, Seaborn, Plotly, Bokeh, Streamlit
Databases:	Oracle, MySQL, PostgreSQL, SQLite, MongoDB, Convex
DevOps & Cloud:	Docker, Jenkins, GitHub Actions, Coolify, Google Cloud, Microsoft Azure
Software Engineering:	Git, Jira, Testing (Unit, Integration, E2E, TDD), Agile/Scrum
Languages:	English (Advanced, YDS Exam Score: 86.25/100), Turkish (Native)
